

INCUBATENERGY LABS 2023 Demo Days

Powered by **FORTIS** INC.

November 1-2
Vancouver, BC
Canada

Downtime, failures and wildfires cost utilities a lot of money. And utilities can't predict what and when equipment will fail.

High Cost

Time consuming

Lack of Data

CRWN

Using sound to predict
failures on the **most remote**
lines **before** they happen.

ENERGY PROVIDERS

The Pilot

Can electrical discharge give insights
into **predicting failures** and
prioritizing maintenance?

Pilot Overview

To show that CRWN can detect, categorize and localize different types of electrical discharge (outside of just corona), in real time without an operator.

1 Month Deployment (& still collecting!) in 4 different sites

5 Categories- No Activity, Low Corona, Medium Corona, **Tracking & Arcing**

10 devices, 63kV, 138kV, 230 kV Tx lines

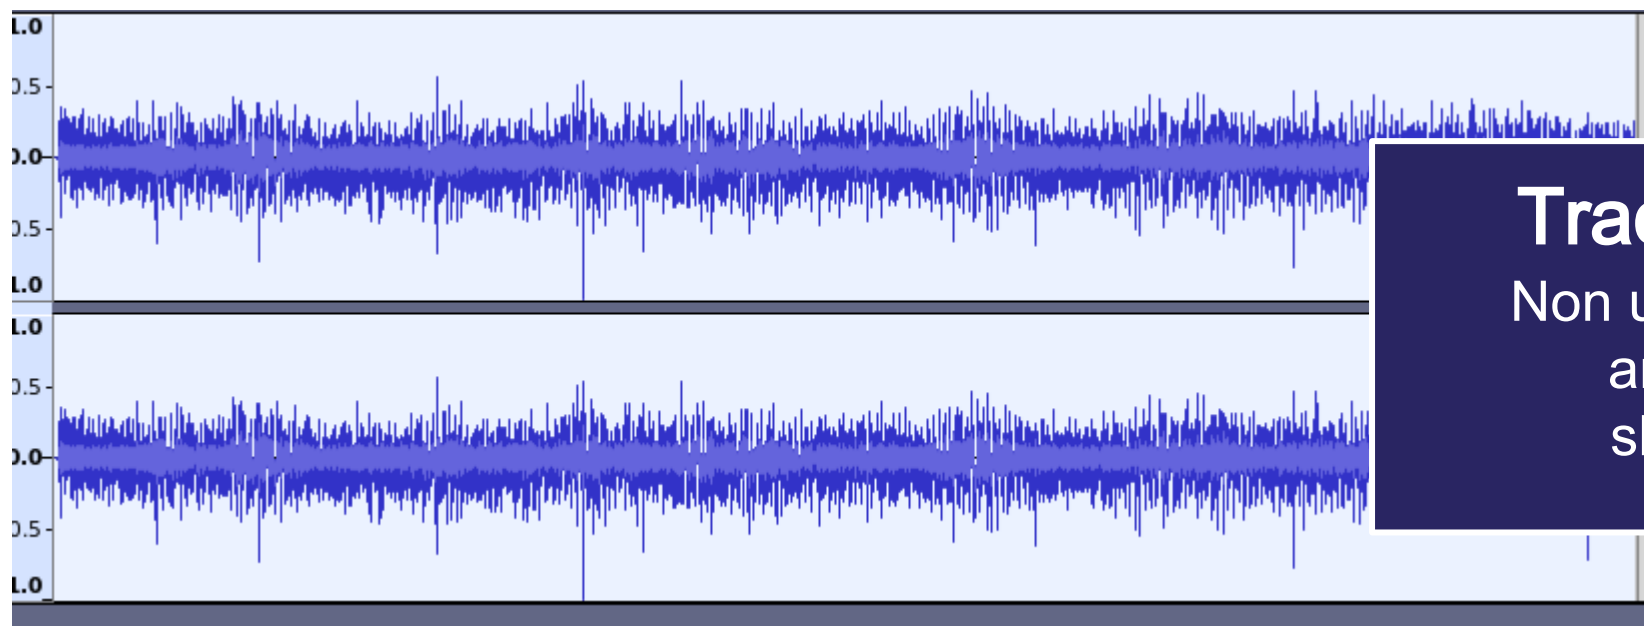

Ultrasound data and AI/**Real time** detection

Key Findings - Issue identification

We can detect:

- ▣ Arcing with Ultrasound
- ▣ Tracking in the field with Ultrasound
- ▣ Distribution of Partial Discharge Type different from one location to the next.

Tracking in Field
Non uniform, varying in
amplitude and
short duration

Key Findings - Data Over Time

Device 71 - 73L2A (New Line)

1- No Activity 2 Light Corona 3 Medium Corona 4 Tracking 5 Arcing

Over a one month period with 10 devices feeding live:

- Electrical Discharge changes throughout the day, as expected
- Tracking does not exist without characteristic Corona Activity
- Tracking and Arcing events happen much less often than Corona activity, as expected

A large orange circle is centered on a dark blue background. Surrounding this circle is a thin white line with several icons placed at intervals: a lightning bolt in an orange circle, a factory in an orange circle, a green square with a sun and clouds, a green circle with wavy lines, a blue hexagon with a power plant, a blue hexagon with a lightning bolt, a blue hexagon with a circuit diagram, and an orange square with a stylized bird or leaf logo. The text 'CRWN.ai' is written in a bold, dark blue font across the center of the orange circle.

CRWN.ai

Tells you what's
happening on the line,
you don't have to guess.

Expected vs Reality

73L2A
Brand New Line
230kV

Expectation
Low Activity

Reality

~**30%** of time
Medium-High
Activity

Expected vs Data Reality

72L183
Corroded Insulator
230 kV

Expectation
High Activity

Reality

95% of time
No-Low Activity

Expected vs Data Reality

73L22
Control Pole
138 kV

Expectation
Unknown

Reality

~70% of time
Medium to High
Activity

Key Questions

72L2A Brand New Line

Some severe activity

Expected: Low Activity
Reality: 28.8% Medium-High Activity

73L22 Control Pole

A lot of Activity

Expected: Unknown
Reality: 68.7% Medium-High Activity

72L183 Corroded Insulator

Limited Activity

Expected: High Activity
Reality: 4.3% Medium - High Activity

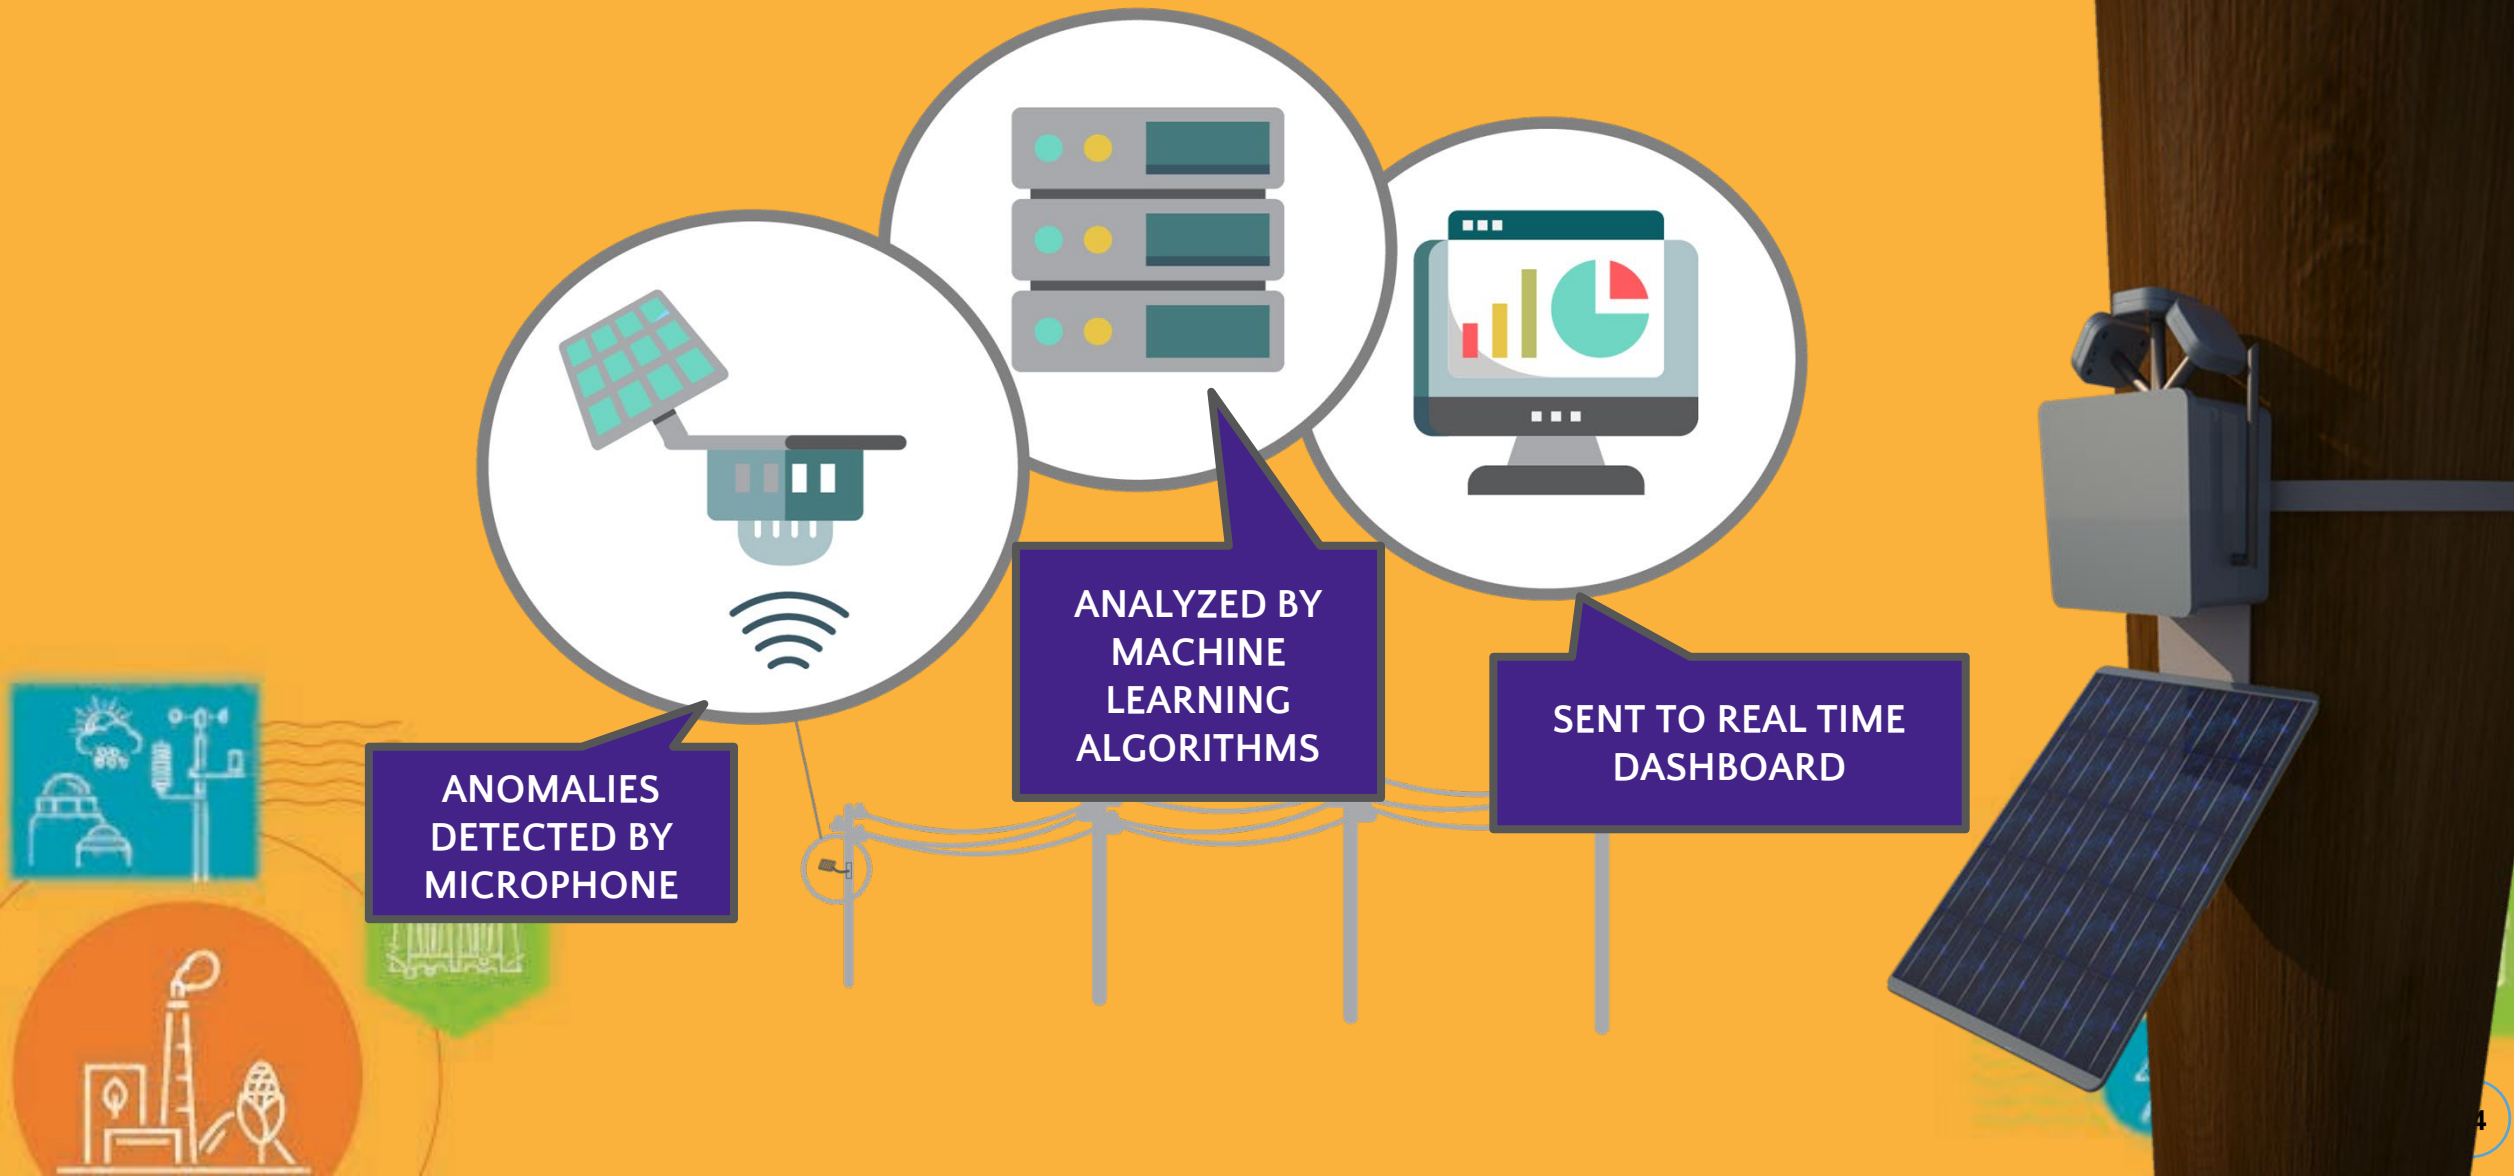

CRWN can automatically detect, categorize and locate **Corona**,
Arcing & Tracking in real time.

CRWN Technology

What's Next

We know CRWN can tell **what**
is happening on your lines.

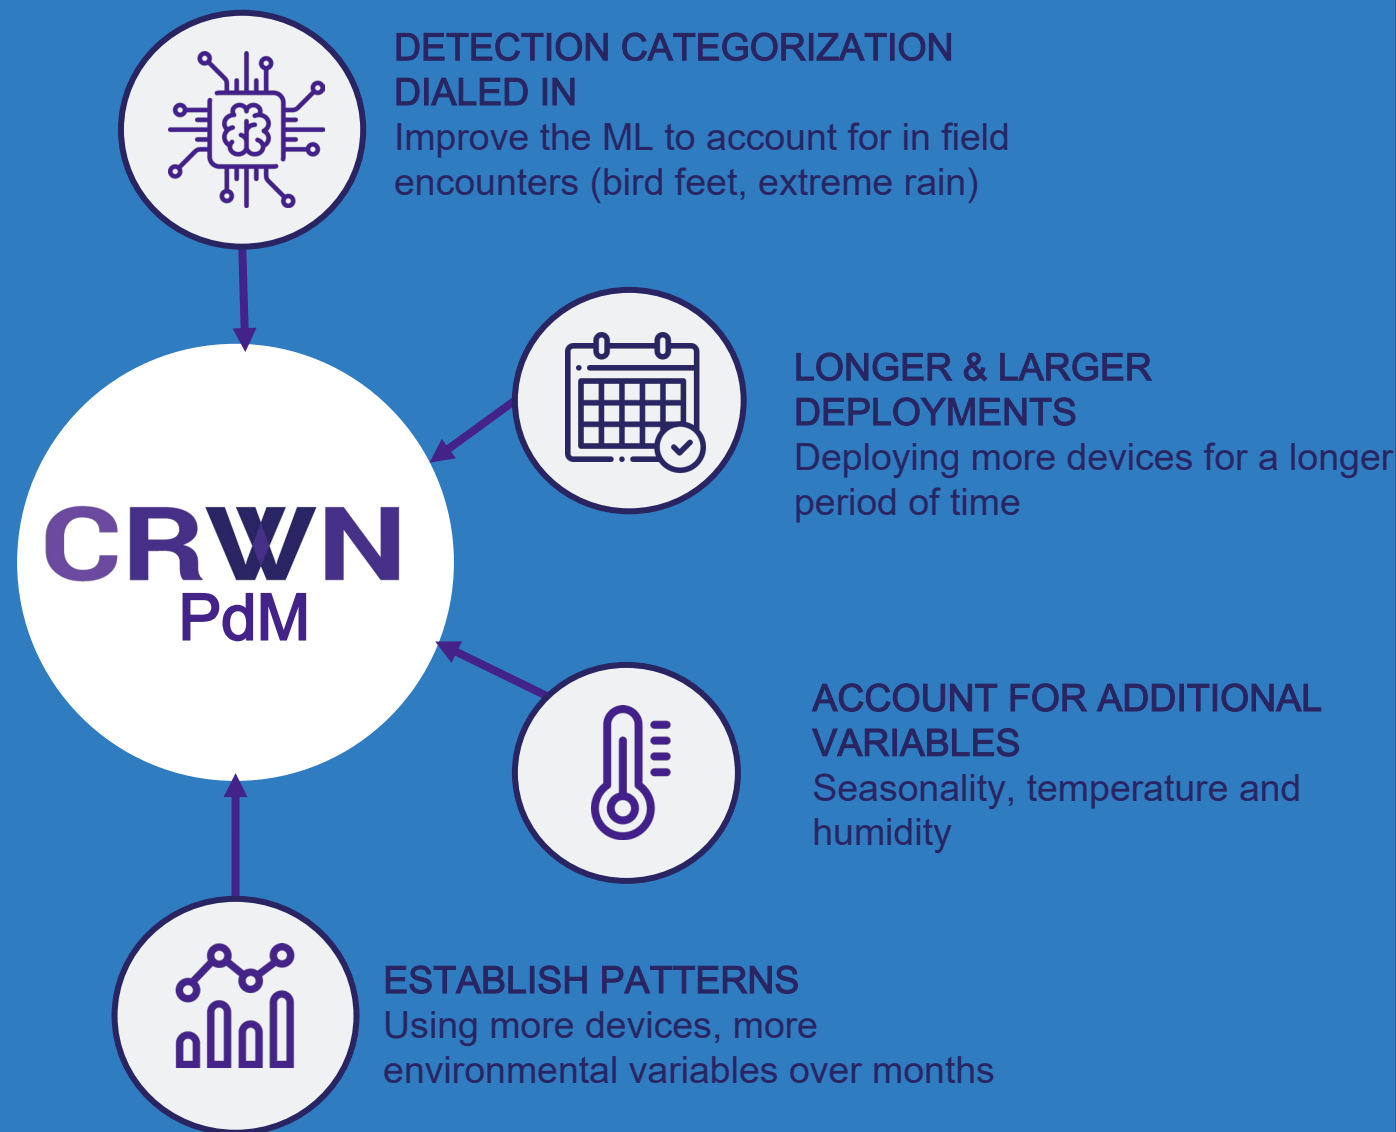

Next we want to help Utilities
understand **why** they are
happening.

What's Next- Helping Utilities Understand Why.

Using CRWN's **defect categorization** and **Predictive Maintenance (PdM)** algorithms deployed across critical Transmission lines will allow Utilities to **increase efficiency**, **better mitigate risks** and **increase uptime** for the end customer.

Our Team

Come see us at our table!
We're looking for early adopters.

Brittany Courvoisier-Nicol
